

- Don: documents with $\text{credibility}(d) \neq \text{ok}$ or $\max(\text{dense_sim}, \text{sparse_sim}) < \sigma_{\min}=0.20$ are excluded; deduplication by key $\kappa(d) := d.\text{doc_id}$ collapses overlap between the dense ($k_d=7$) and sparse ($k_s=3$) branches; the returned set has cardinality at most $k_{\text{final}}=10$.
- Hisoka: is reachable only when both $\text{precision} \geq 0.5$ and $\text{speed} \geq 1.0$ cmd/s; the novice path is reachable when the attacker's tool set intersects the basic-tool set; generation is retried up to 2 times under a 90s budget, and persistent failure degrades to $\text{SAFEFALLBACK}(\ell, \text{preservingtheskill} - \text{tierpersona})$.
